Overview

The HTML content model

Working with semantic elements

Using our code in older browsers

The HTML Content Model

The Old Content Model

Inline

Don't start new line

Contains text or other inline elements

``, ``, `<a>`, ``

Block

Start a new line

Take up all available width

`<h1>`, `<div>`, `<p>`

HTML is about giving meaning to content

- Semantic elements

Layout is handled by CSS

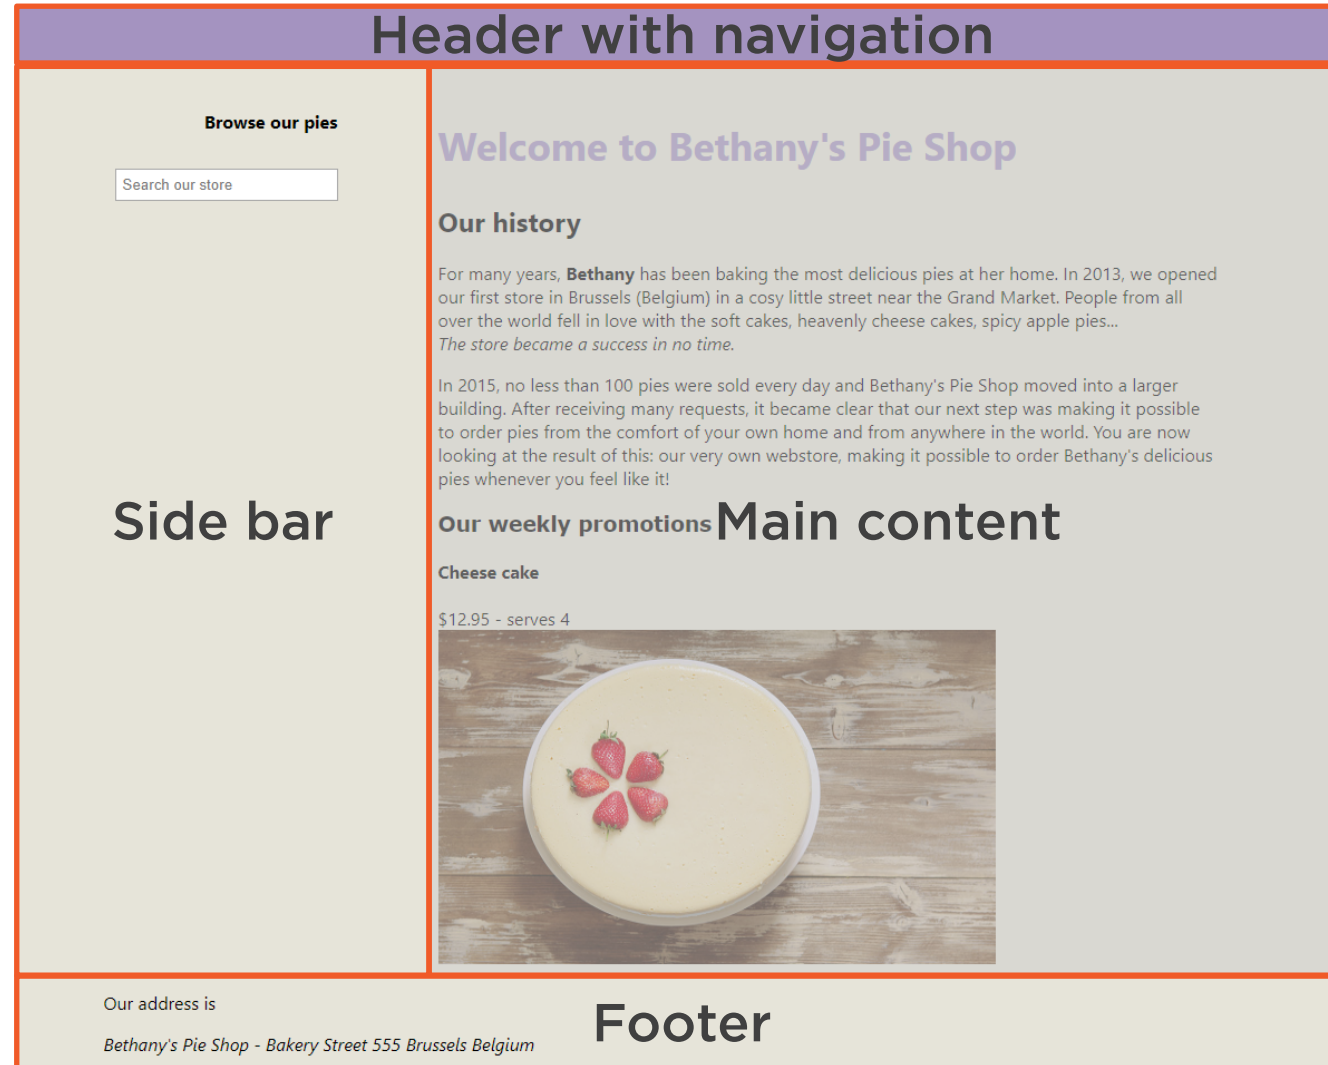

Content types

- Metadata
- Flow
- Sectioning
- Phrasing
- Heading
- Embedded
- Interactive

Working with Semantic Elements

The Target Page

<div>

- Used for separating page in different blocks
- Superseded by semantic elements
- Purely used for layout

<div>

```
<div id="header">
```

```
<div id="sidebar">
```

```
<div id="main">
```

```
<div id="footer">
```

Sectioning Semantic Elements

`<article>`

`<section>`

`<nav>`

`<aside>`

Flow Content Elements

<header>

<footer>

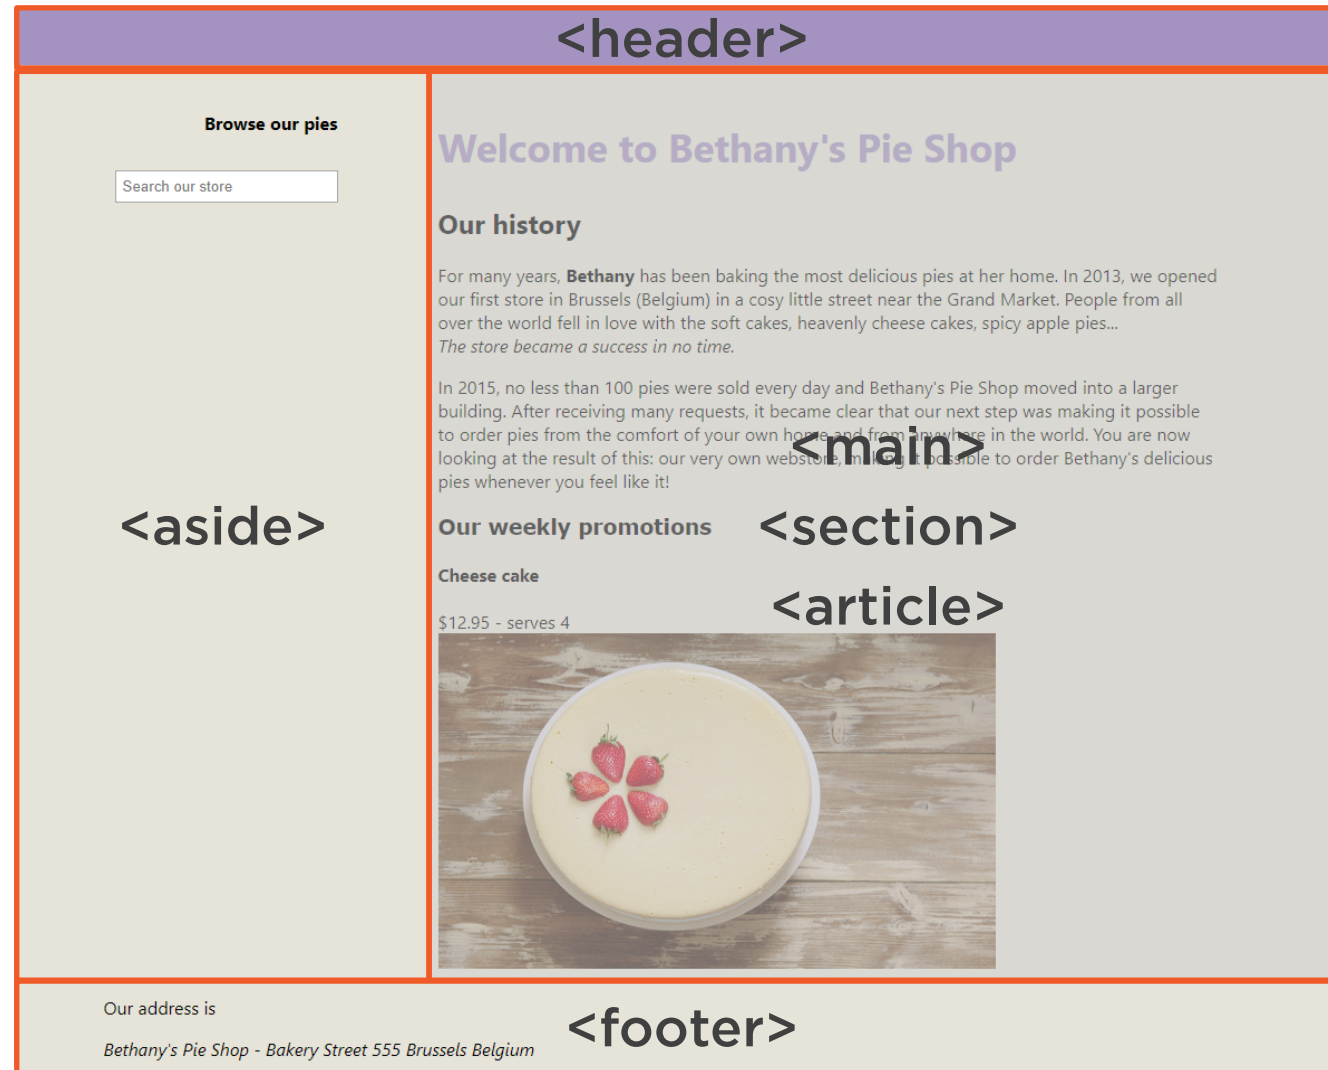

<main>

<address>

The Target Page

What to choose?

Different elements are sometimes closely related

Your page will still work if you choose a different element

Demo

Creating our page outline

Adding the main content

Learning More

CSS Path:

www.pluralsight.com/paths/css

Demo

Exploring other site's structure

Using Chrome dev tools

Using Our Code in Older Browsers

Older browsers are still around

Don't know these elements

- Added with HTML5
- Mostly pre-Internet Explorer 9
- Fixed with script

Demo

Making our page work in old browsers

Summary

Semantic elements give meaning to content

Styles are used to apply UI information
